

KIAH Health homepage refresh

Light theme with medical green accents concept - a modern, responsive healthcare website that preserves the existing homepage information while improving credibility, navigation and visual quality.

A clearer, more credible first impression.

The refreshed homepage is intended to present KIAH Health as an experienced remote-health and emergency-response provider, rather than as a legacy information site. The concept keeps the company's current story, people, services and existing imagery, but restructures them into a modern client journey.

What changes

- Rebuilt visual hierarchy and responsive layout.
- High-resolution medical, emergency and industrial imagery sized for each location.
- Vector recreation of the existing logo to remove pixelation and white background artefacts, with the PTY LTD suffix removed at stakeholder request.
- Clear capability, clinic, EPOD, international, team and contact sections.
- Calls to action for capability statements and project enquiries.
- Visible governance notes where content requires verification.

What stays

- The KIAH brand identity and green visual language.
- Knowledge, Integrity, Accessibility and Holistic values.
- Current service descriptions and operational positioning.
- Deployable 20-foot and 40-foot clinic information.
- EPOD, clinical staffing, international and training information.
- Leadership, team and existing homepage photographs.
- Current contact information, subject to final validation.

Outcome: a homepage that can support stakeholder discussions now, while remaining a practical foundation for a future WordPress or lightweight CMS build.

USER JOURNEY

Information is revealed in the order a prospective client needs it.

1

Establish trust

Logo, positioning, experience indicators and relevant imagery make the first screen feel deliberate and established.

2

Explain capability

Services are grouped by client need rather than presented as an unstructured long-form page.

3

Convert interest

Capability downloads, contact details and a structured enquiry form create a practical next step.

Existing homepage content has a defined home.

The redesign does not discard the current site. It separates high-level selling messages from detailed supporting information, so the page remains easy to scan without losing substance.

Existing homepage information	Refreshed treatment
Business overview and international positioning	Hero and About sections with a concise service proposition and supporting background.
Knowledge, Integrity, Accessibility, Holistic	Four-value panel using consistent visual cards.
Clinical, remote, occupational and aeromedical services	Six capability pathways and expanded clinical staffing content.
Mobile clinics and hospitals	Dedicated deployable-clinic section with 20-foot, 40-foot, fit-out and tracking information.
EPOD emergency deployment	High-impact full image and structured list of deployment uses.
International network and languages	Regional-response section with map visual and language tags.
Baf Kuka biography and named team	Leadership feature plus grouped medical and operational team profiles.
Training, consulting and preparedness	Dedicated training section with operational imagery and capability list.
Existing photographs	Retained in an editorial gallery at their appropriate resolution.
Detailed clinical and governance claims	Expandable information panels, with verification wording before publication.
Contact information	Readable contact cards and a future-ready enquiry form.

Governance benefit: legal entity, ABN, professional registrations, RTO wording and team roles are highlighted for verification instead of being silently carried into a new site.

MEDICAL GREEN DIRECTION

Light theme with medical green accents visual language.

Rebuilt logo asset

The existing mark has been recreated as cropped vector artwork without the PTY LTD suffix. It remains sharp at any screen size and can sit on transparent, light or dark backgrounds.

Responsive behaviour

Core palette

Typography

A measured, confident heading scale creates hierarchy without forcing content unnecessarily far down the page. Body copy remains readable and does not depend on paid or externally loaded fonts.

Imagery

Medical, emergency response and industrial photography is cropped for the exact component ratio. Existing lower-resolution photographs remain smaller editorial assets rather than stretched backgrounds.

WHY THE REFRESH MATTERS

Benefits beyond appearance.

Stronger credibility

Consistent imagery, spacing, logo quality and typography support a more established market presence.

Faster comprehension

Visitors can identify the main capabilities without reading the entire page.

Better conversion

Clear calls to action connect interest with a capability statement or enquiry.

Preserved organisational knowledge

Existing information is retained, reorganised and easier to maintain.

Mobile readiness

The same content adapts to phones and tablets without a separate mobile site.

Accessibility foundation

Semantic sections, keyboard focus, contrast and readable sizing are included from the start.

Lower technical risk

The concept requires no customer login, patient portal or custom database.

Future expansion

Individual capability pages, case studies, training and recruitment can be added without redesigning the homepage.

DEPLOYABLE MEDICAL FACILITIES

Medical facilities where you need them, when you need them.

KIAH's existing homepage describes immediately deployable mobile hospitals and clinics designed for straightforward international transport.

20-foot format

Compact treatment or clinic configuration.

40-foot format

Expanded treatment and hospital capability.

Custom fit-out

Equipment and internal layout aligned to the task.

Tracked inventory

Patient, medicine, inventory and GPS tracking described.

DEPLOYABLE CLINIC CONCEPT

Illustrative only - final design, engineering and equipment require verification.

Deployable-clinic information becomes a clear product capability rather than being buried in long-form text.

A practical implementation path.

PHASE 1

Validate

Confirm legal entity, contact details, registrations, named team members and service claims.

PHASE 2

Prepare

Approve final imagery, obtain client-approved case studies and create a capability statement.

PHASE 3

Build

Implement in a clean WordPress installation or lightweight CMS with reusable components.

PHASE 4

Launch

Complete device testing, accessibility checks, SEO migration, analytics consent and redirects.

Recommended production scope

- Home, Services, Industries, About and Contact pages.
- Individual remote health, clinical staffing, mobile clinic and emergency deployment pages.
- Client-approved case studies.
- Downloadable capability statement.
- Secure enquiry form with spam protection.
- Privacy, terms, accessibility and cookie controls.
- Google Analytics, Search Console and LinkedIn integration.

Technical position

- No public login is required for this marketing site.
- No patient or clinical data should be stored in the public website.
- The CMS database would only hold page content, settings and approved form records.
- Future training, student or patient portals should be separate systems.
- Use managed hosting, daily backups, staging, HTTPS and controlled administrator access.

Decision requested: choose the preferred visual direction, confirm the content owner and approve a validation phase before production development.
